

The clock is ticking on America's alternative energy needs.

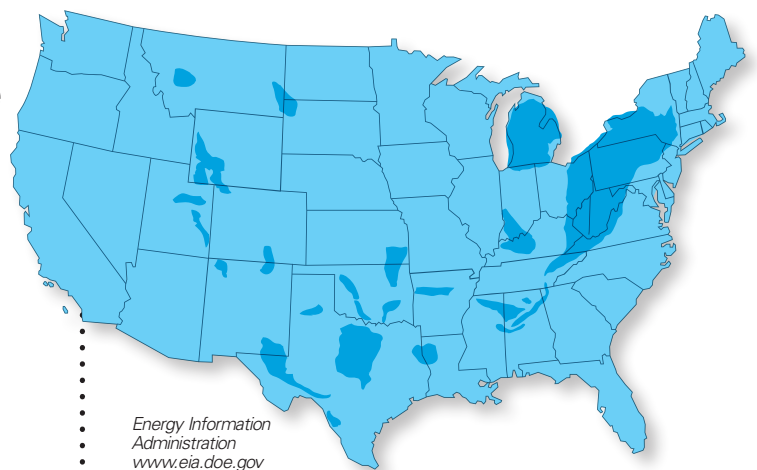

In the meantime, here's a plan for the next 100+ years.

With more than a 100-year supply right here in America, clean-burning natural gas is the ready alternative to reduce emissions and increase energy security.

As America begins the bold and unprecedented journey toward alternative fuel sources, one critical component becomes clear. There must be a clean burning alternative fuel to keep the power flowing when the wind doesn't blow and the sun doesn't shine. An alternative fuel ready today, with enough capacity to last as long as this journey takes.

Natural gas is America's alternative fuel, with some of the world's largest natural resources found within the borders of our country. Which means the money to power America, stays in America.

Clean-burning natural gas, purely American.
